Virological Surveillance Summary

In the Western Pacific Region, the following influenza viruses predominated:

<table>
<thead>
<tr>

</table>

Countries providing specimens for FluNet reporting from the Western Pacific Region include Australia, Cambodia, China, Fiji, Lao PDR, Malaysia, Mongolia, New Zealand, Philippines, the Republic of Korea, Singapore, and Viet Nam. From week 1 to week 48, 90.1% of influenza specimens provided to FluNet were from China (n=522,901), 3.4% from Australia (n=19,489), 2.5% from New Zealand (n=14,379) and 1.7% from the Republic of Korea (n=9,822).

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient sentinel surveillance systems. Case definitions, populations under surveillance and data formats differ among these countries. This influenza surveillance summary includes countries where routine surveillance is conducted and information is available from syndromic surveillance systems for Influenza-like-illness (ILI) and Severe Acute Respiratory Infections (SARI). The WHO surveillance case definition for ILI is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection with a history of fever or measured fever of ≥38°C and cough, with symptom onset within the last 10 days and requires hospitalization.
Countries in the temperate zone of the Northern Hemisphere

In most countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity remained at low levels.

**Outpatient ILI Surveillance**

**China (North)**

During week 48, ILI activity remained low and consistent with the seasonal trend of previous years (2011–2014). ILI% at national sentinel hospitals in north China was 2.6%, higher than the previous week (2.5%) (Figure 2).

**Mongolia**

In week 47–48, 2015, ILI activity in Mongolia has increased and follows the seasonal trend (Figure 3).

**Republic of Korea**

In week 48, 2015, the proportion of patients visiting sentinel physicians for ILI (5.4/1,000 outpatients) following the seasonal trend of previous years (2012-2014) and was below baseline (Figure 4).

![Figure 4: Weekly proportion of ILI visits per 1,000 patients 2012-2015 (Source: Korean Centre for Disease Control and Prevention)](image)
**Hospital influenza surveillance**

**Japan**

In Japan, the number of influenza cases reported weekly per hospital sentinel site follows the known seasonal trend (2005–2014), with case numbers remaining low (Figure 5).

**Countries/areas in the tropical zone**

In week 47-48 of 2015, ILI or Acute Respiratory Infection (ARI) activity followed previous seasonal trends in countries/areas in the tropical zone.

**Outpatient Surveillance**

**Hong Kong (China) - ILI Surveillance**

During week 48, the overall influenza activity remained low. The average consultation rate for ILI among sentinel general outpatient clinics (GOPCs) was 5.3 ILI cases per 1,000 consultations, which was higher than 4.3 ILI cases per 1,000 consultations recorded in the previous week (Figure 6).

The average consultation rate for ILI among sentinel private doctors was 42.6 ILI cases per 1,000 consultations, which was higher than the 41.3 cases recorded in the previous week (Figure 7).

The percentage of respiratory specimens in week 48 which tested positive for seasonal influenza viruses was 1.61% (n=45), higher than the previous week (0.79%). Of the positive results in week 48, 33.3% were influenza A(H1) viruses, 33.3% were influenza B, 17.8% were influenza C, and 15.6% were influenza A(H3N2).

**China (South) - ILI Surveillance**

During week 48, the percentage of outpatient or emergency visits for ILI at national sentinel hospitals in south China was 2.5%, lower than the previous week (2.6%) (Figure 8). The level of influenza A(H3N2) (45.1%) and influenza B (49.3%) were the predominant strains detected.
Influenza Situation Update

8 December 2015

Singapore – ARI Surveillance

In week 46-47, the average daily number of patients seeking treatment in the polyclinics for ARI decreased from 2,673 (over 5.5 working days) in week 46 to 2,488 (over 5.5 working days) in week 47 (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI remained low at approximately 1%. The overall prevalence of influenza among ILI samples (n=92) in the community was 26.1% in the past 4 weeks. Of the specimens tested positive for influenza in November 2015, 45.8% were influenza B, 37.5% were influenza A(H3N2) and 16.7% were influenza A (H1N1)pdm09.

Hong Kong (China) - ILI Surveillance

Countries in the temperate zone of the southern hemisphere

*Influenza surveillance data from Australia and New Zealand is reported during their influenza season and will not be updated in this report unless unusual activity is apparent.*
Pacific Island Countries and Areas (PICs) - ILI Surveillance

In the Pacific Island Countries and Areas, as of week 48, the numbers of ILI cases reported remain high in Guam, New Caledonia, Niue, and Vanuatu (Figure 10).
