Virological Surveillance Summary

In the Western Pacific Region, the following influenza viruses predominated:

<table>

Countries providing specimens for FluNet reporting from the Western Pacific Region in 2016 include Cambodia, Lao PDR, Philippines, the Republic of Korea and Singapore. From week 1 to week 5 of 2016 64% of influenza specimens provided to FluNet were from Korea (n=1158), 16.5% from Singapore (n=297), 11.1% from Lao PDR (n=201), 6.9% from Philippines (n=124) and 1.2% from Cambodia (n=22).

Number of specimens positive for influenza by subtype

**Influenza surveillance summary**

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient sentinel surveillance systems. Case definitions, populations under surveillance and data formats differ among these countries. This influenza surveillance summary includes countries where routine surveillance is conducted and information is available from syndromic surveillance systems for Influenza-like-illness (ILI) and Severe Acute Respiratory Infections (SARI).

The [WHO surveillance case definition](https://www.who.int/influenza/surveillance_monitoring/case_def/en/) for ILI is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection with a history of fever or measured fever of ≥38°C and cough, with symptom onset within the last 10 days and requires hospitalization.

**Countries in the temperate zone of the Northern Hemisphere**

In most countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity remained at low levels.

**Outpatient ILI Surveillance**

**China (North)**

In week 3, 2016, ILI activity remained lower than the general seasonal trend observed in the majority of previous years (2011–2015). Proportion of hospital visits that were ILI at national sentinel hospitals in north China was 3.6%, higher than last week (3.3%), same as the same week in 2015 and lower than the same week in 2014 (3.6% and 4.2% respectively) (Figure 2).

**Mongolia**

In week 4, 2016, ILI activity in Mongolia is increasing in line with seasonal trend (Figure 3).

**Republic of Korea**

In week 6, 2016, the rate of ILI patient visits to sentinel physicians (41.3/1,000 outpatients) followed the seasonal trend of previous years (2012–2015) and was above baseline (11.3/1,000 outpatients) (Figure 4).

Sentinel influenza surveillance

Japan

As of 3 February 2016 in Japan, the number of influenza cases reported weekly per hospital sentinel site followed the known seasonal trend (2005-2015), with case numbers remaining low (Figure 5).

Figure 5: Number of influenza cases reported weekly per sentinel hospital site, Japan 2006-2016 (Source: Japan National Institute of Infectious Diseases)
Countries/areas in the tropical zone

In week 1-6 of 2016, ILI or Acute Respiratory Infection (ARI) activity followed previous seasonal trends in countries/areas in the tropical zone.

Outpatient Surveillance

Hong Kong (China) - ILI Surveillance
During week 6, overall influenza activity has continued to increase. The average consultation rate for influenza-like illness (ILI) among sentinel general outpatient clinics (GOPCs) was 7.5 ILI cases per 1,000 consultations, which was higher than 5.6 per 1,000 recorded in the previous week (Figure 6).

The average consultation rate for ILI among sentinel private doctors was 53.4 ILI cases per 1,000 consultations, which was higher than 40.1 per 1,000 recorded in the previous week (Figure 7).

The percentage of respiratory specimens in week 6 which tested positive for seasonal influenza viruses was 16.34%, which was higher than recorded in the previous week (9.25%). Of all respiratory specimens tested in week 6, 6643 (16.34%) were tested positive for seasonal influenza viruses, including 406 (10.32%) influenza A(H1), 53 (1.35%) influenza A(H3), 152 (3.86%) influenza B and 32 (0.81%) influenza C.

China (South) - ILI Surveillance
During week 3, the percentage of outpatient or emergency visits for ILI at national sentinel hospitals in south China was 3.4%, higher than last week (3.2%) (Figure 8). In South China, influenza A was the predominant type of influenza detected (74.5%). Of the influenza A subtypes, A (H1N1)pdm09 was the most common (86%).

Singapore – ARI Surveillance
The average daily number of patients seeking treatment in the polyclinics for ARI increased from 3,111 (over 5.5 working days) in week 4 to 3,125 (over 5.5 working days) in week 5 (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI remained low at approximately 1%. The overall prevalence of influenza among ILI samples (n=245) in the community was 62.0% in the past 4 weeks. Of the specimens tested positive for influenza in January 2016, these were positive for influenza B (45.0%), influenza A(H3N2) (28.9%), and influenza A (H1N1)pdm09 (26.1%).

Countries in the temperate zone of the southern hemisphere

Influenza surveillance data from Australia and New Zealand is reported during their influenza season and will not be updated in this report unless unusual activity is apparent.

Pacific Island Countries and Areas (PICs)- ILI Surveillance

In the Pacific Island Countries and Areas, as of week 5, the number of ILI cases reported is higher than the previous weeks in American Samoa, Federated States of Micronesia, Fiji, Marshall Islands, Palau, Samoa, and Solomon Islands (Figure 10).
