Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient sentinel surveillance systems. Case definitions, populations under surveillance and data formats differ among these countries. This influenza surveillance summary includes countries where routine surveillance is conducted and information is available from syndromic surveillance systems for Influenza-like-illness (ILI) and Severe Acute Respiratory Infections (SARI).

The **WHO surveillance case definition** for ILI is an acute respiratory infection with a measured fever of \( \geq 38^\circ C \) and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection with a history of fever or measured fever of \( \geq 38^\circ C \) and cough, with symptom onset within the last 10 days and requires hospitalization.

Countries in the temperate zone of the Northern Hemisphere

In most countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity remained at low levels.

**Outpatient ILI Surveillance**

**China (North)**
In week 6 2016, ILI activity increased to a level above seasonal peaks observed since 2011. The proportion of hospital visits that were for ILI at national sentinel hospitals in north China in week 6 was 4.6%, compared to 3% in week 5 of 2016, and 3.5% and 2.8% in the corresponding week of 2014 and 2015 respectively (Figure 2).

**Mongolia**
In week 7, 2016, ILI activity in Mongolia is increasing in line with seasonal trend (Figure 3).

**Republic of Korea**
In week 8, 2016, the rate of ILI patient visits to sentinel physicians (46.1/1,000 outpatients) followed the seasonal trend of previous years (2012-2015) and was above baseline (11.3/1,000 outpatients) (Figure 4).

Sentinel influenza surveillance

Japan

As of 24 February 2016, the number of influenza cases reported weekly, per sentinel hospital site increased in line with previous seasons peaks.

Figure 4: Number of influenza cases reported weekly per sentinel hospital site, Japan 2006-2016
(Source: Japan National Institute of Infectious Diseases)
Countries/areas in the tropical zone

In weeks 1 to 8 of 2016, ILI or Acute Respiratory Infection (ARI) activity followed previous seasonal trends in countries/areas in the tropical zone.

**Outpatient Surveillance**

**Hong Kong (China) - ILI Surveillance**

During week 8, overall influenza activity remained at a high level. The average consultation rate for influenza-like illness (ILI) among sentinel general outpatient clinics was 9.0 ILI cases per 1,000 consultations, which was lower than 10.6 per 1,000 recorded in the previous week (Figure 6).

The average consultation rate for ILI among sentinel private doctors was 47.6 ILI cases per 1,000 consultations, which was lower than 54.7 per 1,000 recorded in the previous week (Figure 7).

The percentage of respiratory specimens in week 8 which tested positive for seasonal influenza viruses was 24.2%, slightly higher than that recorded in the previous week (22.9%). Of all respiratory specimens tested in week 8, 1,185 (24.2%) tested positive for seasonal influenza viruses, including; 771 (15.7%) influenza A (H1), 49 (1.0%) influenza A (H3), 323 (6.6%) influenza B and 42 (0.9%) influenza C.

**China (South) - ILI Surveillance**

During week 6, the percentage of outpatient or emergency visits for ILI at national sentinel hospitals in south China was 5.6%, higher than last week (4.2%), as well as the corresponding weeks of 2014 and 2015 (4.1% and 2.9% respectively) (Figure 8). In South China, influenza A was the predominant type of influenza detected (78.9%). Of the influenza A subtypes, A (H1N1) pdm09 was the most common (95.5%).

**Singapore – ARI Surveillance**

The average daily number of patients seeking treatment in the polyclinics for ARI decreased from 3,740 (over 3.5 working days) in week 6 to 3,174 (over 5.5 working days) in week 7 (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI remained low at approximately 1%. The overall prevalence of influenza among ILI samples (n=244) in the community was 60.7% in the past 4 weeks. Of specimens that tested positive for influenza in January 2016, 45% were positive for influenza B, 28.9% for influenza A (H3N2), and 26.1% for influenza A (H1N1) pdm09.

Countries in the temperate zone of the southern hemisphere

Influenza surveillance data from Australia and New Zealand is reported during their influenza season and will not be updated in this report unless unusual activity is apparent.

Pacific Island Countries and Areas (PICs)- ILI Surveillance

In the Pacific Island Countries and Areas, as of week 6, the number of ILI cases reported is higher than the previous weeks in Fiji, Northern Mariana Islands and Palau. (Figure 10)
