Virological Surveillance Summary

The number of specimens reported to FluNet by the Western Pacific Region countries and areas between week 1 and week 17, and the number of influenza positive specimens, are presented in the table below. Influenza A(H1) is currently the predominant circulating subtype (Figure 1).

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient sentinel surveillance systems. Case definitions, populations under surveillance and data formats differ among these countries. This influenza surveillance summary includes countries where routine surveillance is conducted and information is available from syndromic surveillance systems for influenza-like-illness (ILI) and Severe Acute Respiratory Infections (SARI).

The WHO surveillance case definition for ILI is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within the last 10 days and requires hospitalization.

Countries in the temperate zone of the Northern Hemisphere

In most countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity are consistent with seasonal trends but indicate an earlier start to the influenza season compared to the 2015-2016 season.

Outpatient ILI Surveillance

China (North)
During weeks 16 and 17, the percentage of visits for ILI at national sentinel hospitals in northern China was 3.1% and 3.2%. Compared to previous years, ILI activity was a little higher than the same weeks of the 2014-2016 (2.4% ~ 2.6%)(Figure 2).

Mongolia
ILI activity remained low during week 17 of 2017 compared to the previous week and seasons. The most recent peak in ILI activity occurred in week four of 2017 (Figure 3).

Republic of Korea
In week 17 2017, there were 13.3 ILI cases per 1000, which was lower than 14.5 per 1000 in the previous week. ILI activity was on a downward trend. (Figure 4).

**Sentinel influenza surveillance**

**Japan**

As of week 15 2017, influenza activity in Japan is following a similar seasonal pattern to the previous years. (Figure 5).

Figure 5: Number of influenza cases reported weekly per reporting sentinel hospital site, Japan 2007-2017
(Source: Japan National Institute of Infectious Diseases)
Countries/areas in the tropical zone
In weeks 1 to 17 of 2017, ILI and ARI activity followed previous seasonal trends in countries/areas in the tropical zone.

Outpatient Surveillance

Hong Kong (China) - ILI Surveillance
Surveillance data indicate an increase in local influenza activity in recent weeks. In weeks 16 and 17 of 2017, the consultation rate for ILI among sentinel general outpatient clinics was 3.6 and 4.0 ILI cases per 1,000 consultations respectively. The average consultation rate for ILI among sentinel private doctors was 31.6 ILI cases per 1000 consultations in week 16 and 49.9 per 1000 consultations in week 17 (Figure 6 & Figure 7).

China (South) - ILI Surveillance
During weeks 16 and 17, the percentage of outpatient or emergency visits for ILI at national sentinel hospitals in southern China was 3.2% and 3.1% respectively, which was similar to previous seasons (Figure 8).

Singapore – Acute Respiratory Infection Surveillance
The average daily number of patients seeking treatment in the polyclinics for acute respiratory infection decreased from 3,202 (over 5.5 working days) in week 16 to 3,189 (over 5.5 working days) in week 17. (Figure 9). The proportion of patients with ILI among polyclinic attendances for ARI remained low at 2.8%.
Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity followed seasonal trends.

**Australia – Laboratory-confirmed influenza (no update)**

As of 28 October 2016, a total of 83,092 notifications of laboratory confirmed influenza were reported to the National Notifiable Diseases Surveillance System (Figure 10). Ninety percent of notifications were influenza A (73% A (unsubtyped), 6% influenza A(H1N1)pdm09 and 11% influenza A(H3N2), 10% were influenza B and less than 1% were influenza C, influenza A&B co-infections or untyped. Australia publishes influenza surveillance reports on a fortnightly basis during the influenza season, typically between May and October. **New Zealand – Influenza like Illness**

In week 17, influenza activity was very low among consultation-seeking patients nationwide; 15 patients with ILI consulted sentinel general practices in 20 District Health Boards. The weekly ILI incidence was 3.1 ILI cases per 100,000 patients (Figure 11).
**Pacific Island Countries and Areas (PICs) - ILI Surveillance**

In the Pacific Island Countries and Areas, in week 15, the number of ILI cases reported was at a relatively high level in Kinbati (Figure 12).
