Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between weeks 1 and 38 are presented in the table below. Influenza A and B have co-circulated throughout the year and A(H1N1) has predominated in recent weeks (Figure 1).

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient sentinel indicator based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included, and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.
Influenza Situation Update

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization.

Countries in the temperate zone of the Northern Hemisphere

In most countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity is similar to the corresponding period from previous years.

Outpatient ILI Surveillance

**China (North)**

During week 37, the percentage of visits for ILI at national sentinel hospitals in northern China was 2.1%, which is the same as the last week (2.1%) and lower than the same week of 2016-2017 (Figure 2).

**Mongolia** (no updates)

During week 23, ILI activity in Mongolia increased from the previous week and is below the upper tolerance limits (Figure 3).

**Republic of Korea**

In week 37, overall weekly influenza like illness (ILI) rate was 4.3 ILI cases per 1,000 outpatient visits (Figure 4).

Sentinel influenza surveillance

Japan
In week 36 influenza activity in Japan remained low, consistent with trends during the same period between 2008 and 2017 (Figure 5).

Countries/areas in the tropical zone
Countries and areas in the tropical zone are observing influenza activity that is consistent with previous seasons.

Surveillance

Hong Kong SAR (China) – ILI and hospital Surveillance
In week 37, the average consultation rate for ILI among sentinel outpatient clinics was 5.5 ILI cases per 1,000 consultations, which was higher than that recorded in the previous week (3.7 per 1,000) (Figure 6). The average consultation rate for ILI among sentinel private doctors was 31.7 ILI cases per 1,000 consultations, which was lower than the rate recorded in the previous week (48.2 per 1,000) (Figure 7).

![Figure 7: ILI consultation rates at sentinel private doctors, Hong Kong SAR 2014-2018](Source: Hong Kong Centre for Health Protection)
China (South) - ILI Surveillance
During week 37, the percentage of outpatient or emergency visits for ILI at national sentinel hospitals in southern China was 2.7%, same as the last week (2.7%) and lower than the same week of 2016-2017. (Figure 8).

Singapore – Acute Respiratory Infection (ARI) Surveillance
The average daily number of patients seeking treatment in the polyclinics for ARI increased from 2,422 (over 5.5 working days) in week 36 to 2,893 (over 5.5 working days) in week 37. The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI is 1.5%.

Lao PDR
In week 37, ILI activity decreased compared to the previous week and is similar to trends seen in previous years. (see Figure 10). On the other hand, Severe Acute Respiratory Infection (SARI) cases remain higher than the previous 5 years (data not shown).
Influenza Situation Update

Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season usually starting in May. Influenza activity in the temperate zone tends to remain at low inter-seasonal levels.

**Australia – Laboratory-confirmed influenza**

The numbers of laboratory confirmed influenza cases and presentations of ILI to general practitioners in week 36 are low and within historical range. There were 7.3 ILI cases per 1,000 consultations at sentinel general practitioners and there have been 30,776 laboratory confirmed cases of influenza reported to the National Notifiable Diseases Surveillance System (Figure 11). Australia publishes influenza surveillance reports on a fortnightly basis during the influenza season, typically between May and October.

![Figure 11: Australian notifications of laboratory confirmed influenza](Source: National Notifiable Diseases Surveillance System, Australian Department of Health)

**New Zealand – Influenza like Illness**

During the week ending 16 September 2018, there were 28.8 general practice visits for influenza-like illness for every 100,000 registered patients. The historical average seasonal rate for the week ending 16 September is 30.8 per 100,000 registered patients. Historical average is based on 2000-2017 seasons (excluding pandemic seasons: 2009).

Pacific Island Countries and Areas (PICs) - ILI Surveillance

In the Pacific Island Countries and Areas, in week 37 the number of ILI cases reported in Samoa, Kiribati, and Tonga increased compared to week 35 (Figure 13).
