Human infection with avian influenza A(H5) viruses

Human infection with avian influenza A(H5N1) virus
From 10 to 16 February 2017, no new cases of human infection with avian influenza A(H5N1) virus were reported to WHO in the Western Pacific Region.

From January 2003 to 16 February 2017, a total of 238 cases of human infection with avian influenza A(H5N1) virus were reported from four countries within the Western Pacific Region (Table 1). The last case was reported on 14 January 2016. Of these cases, 134 were fatal, resulting in a case fatality rate (CFR) of 56%.

From January 2003 to 16 February 2017, there were 856 cases of human infection with avian influenza A(H5N1) virus reported from 16 countries worldwide. Of these cases, 452 were fatal, resulting in a CFR of 52.8%.

Human infection with avian influenza A(H5N6) virus
From 10 to 16 February 2017, no new cases of human infection with avian influenza A(H5N6) virus were reported to WHO in the Western Pacific Region. The last case was reported on 1 December 2016 (source: http://www.who.int/csr/don/07-december-2016-ah5n6-china/en/). A total of 16 laboratory-confirmed cases of human infection with influenza A(H5N6) virus, including six deaths, have been reported to WHO from China since 2014.

Public health risk assessment for human infection with avian influenza A(H5) viruses
Whenever avian influenza viruses are circulating in poultry, sporadic infections and small clusters of human cases are possible in people exposed to infected poultry or contaminated environments; therefore sporadic human cases are not unexpected.

With the rapid spread and magnitude of avian influenza outbreaks due to existing and new influenza A(H5) viruses in poultry in areas that have not experienced this disease in animals recently, there is a need for increased vigilance in the animal and public health sectors. Community awareness of the potential dangers for human health is essential to prevent infection in humans. Surveillance should be enhanced to detect human infections if they occur and to detect early changes in transmissibility and infectivity of the viruses.

Human infection with avian influenza A(H7N9) virus in China

From 10 - 16 February 2017, no additional cases of human infection with avian influenza A(H7N9) virus were published in Disease Outbreak News. The last case of human infection with avian influenza A(H7N9) virus in the Western Pacific Region published through Disease Outbreak News was notified to WHO 12 January 2017. (Source: http://www.who.int/csr/don/18-january-2017-ah7n9-china/en/). A total of 918 laboratory-confirmed human infections with avian influenza A(H7N9) virus were reported to WHO between early 2013 and 12 January 2017.

WHO is continuing to assess the epidemiological situation and will conduct further risk assessments with new information. Overall, the public health risk from avian influenza A(H7N9) viruses has not changed.

Further sporadic human cases of avian influenza A(H7N9) virus infection are expected in affected and possibly neighbouring areas. Should human cases from affected areas travel internationally, their infection may be detected in another country during or after arrival. If this were to occur, community level spread is considered unlikely as the virus does not have the ability to transmit easily among humans.

To date, there has been no evidence of sustained human-to-human transmission of avian influenza A(H7N9) virus. Human infections with the A(H7N9) virus are unusual and need to be monitored closely in order to identify changes in the virus and/or its transmission behaviour to humans as it may have a serious public health impact.

Animal infection with avian influenza virus

From 10 - 16 February 2017, there were outbreaks of highly pathogenic avian influenza A(H5N6) virus reported in poultry in Japan and Myanmar and an outbreak of A(H5N8) in poultry in China

Highly pathogenic avian influenza (HPAI) A(H5N6) virus in Japan and Myanmar
On 10 February 2017, Japan reported to OIE of an update of A(H5N6) event in poultry (broiler breeders) farm in Saga Prefecture.

On 7 February 2017, Myanmar reported to OIE of an update of A(H5N6) event in Layer chicken from collecting points at Monglar, Monglar and Kyaingtong, Shan State, which is bordering China and Lao PDR.

Avian influenza A(H5N8) virus in China
On 9 February 2017, China reported to OIE of an update of A(H5N8) event in mute swan, Cygnus olor (Anatidae) in Shanxi Province.
