

## Human infection with avian influenza A(H5)

From 20 to 26 February 2015, **no new cases** of human infection with avian influenza A(H5) were reported in the Western Pacific Region. The last case of avian influenza A(H5N1) in this region was reported on 28 January 2015 from China and the last case of avian influenza A(H5N6) was reported on 9 February 2015 also from China.

## Human infection with avian influenza A(H5N1)

From 2003 to 26 February 2015, 233 cases of avian influenza A(H5N1) have been reported from four countries in the Western Pacific Region (Table 1). Of these cases, 133 were fatal, resulting in a case fatality rate (CFR) of 57%.

**Table 1: Cumulative number laboratory-confirmed human cases (C) and deaths (D) of influenza A (H5N1) virus infection reported to WHO (January 2003 to 27 February 2015), Western Pacific Region.**

Country	2003		2004		2005		2006		2007		2008		2009		2010		2011		2012		2013		2014		2015		Total	
	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D
Cambodia	0	0	0	0	4	4	2	2	1	1	1	0	1	0	1	1	8	8	3	3	26	14	9	4	0	0	56	37
China	1	1	0	0	8	5	13	8	5	3	4	4	7	4	2	1	1	1	2	1	2	2	2	0	1	0	47	30

Viet Nam	3	3	29	20	61	19	0	0	8	5	6	5	5	5	7	2	0	0	4	2	2	1	2	2	0	0	127	64
<b>Total</b>	<b>4</b>	<b>4</b>	<b>29</b>	<b>20</b>	<b>73</b>	<b>28</b>	<b>15</b>	<b>10</b>	<b>16</b>	<b>11</b>	<b>11</b>	<b>9</b>	<b>13</b>	<b>9</b>	<b>10</b>	<b>4</b>	<b>9</b>	<b>9</b>	<b>9</b>	<b>6</b>	<b>30</b>	<b>17</b>	<b>13</b>	<b>6</b>	<b>1</b>	<b>0</b>	<b>233</b>	<b>133</b>

From 2003 to 23 January 2015, 718 cases have been reported from 16 countries in the world. Of these cases, 413 were fatal, resulting in a CFR of 58%.

## Human infection with avian influenza A(H5N6)

From 2014 to 26 February 2015, three cases of influenza A(H5N6) have been reported globally. All cases were reported from China.

## Public health risk assessment for avian influenza A(H5) viruses

Whenever avian influenza viruses are circulating in poultry, sporadic infections and small clusters of human cases are possible in people exposed to infected poultry or contaminated environments. Human infections remain so far rare and these influenza A(H5) viruses do not currently appear to transmit easily among people. As such, the risk of community-level spread of these viruses remains to be low.

*For more information on confirmed cases of human infection with avian influenza A (H5) virus reported to WHO, visit:*

## Human infection with avian influenza A (H7N9) in China

On 23 February 2015, the Department of Health, Hong Kong Special Administrative Region (SAR), China, notified WHO of 1 additional laboratory-confirmed case of human infection with avian influenza A(H7N9) virus. A total of 572 laboratory-confirmed cases of human infection with avian influenza A(H7N9) virus have been reported to WHO: 552 cases by China National Health and Family Planning Commission, four cases by the Taipei Centers for Disease Control, 13 cases by the Centre for Health Protection, China, Hong Kong SAR, one case in a Chinese traveler reported from Malaysia, and two cases in returned travelers from China reported from Canada.

### Public health risk assessment for avian influenza A(H7N9) viruses

Overall, the public health risk from avian influenza A(H7N9) viruses has not changed since the assessment published on 2 October 2014. To date, there has been no evidence of sustained human-to-human transmission of influenza A (H7N9). WHO does not advise special screening at points of entry with regard to this event, nor does it recommend any travel restrictions be applied.

## Animal infection with avian influenza

From 20 to 26 February 2015 in the Western Pacific Region, animal infections with avian influenza viruses were reported in Japan.

### H5N8 HPAI in a mallard

One case of mallard infection of H5N8 HPAIV was reported in Japan.
