

## Human infection with avian influenza A (H5) viruses

### Human infection with avian influenza A (H5N1) virus

From 11 to 17 July 2015, **no new case** of human infection with an avian influenza A (H5N1) virus was reported in Western Pacific Region.

From February 2003 to 23 June 2015, 237 cases of human infection with avian influenza A (H5N1) virus were reported from four countries within the Western Pacific Region (Table 1). Of these cases, 134 were fatal, resulting in a case fatality rate (CFR) of 57%.

**Table 1: Cumulative number laboratory-confirmed human cases (C) and deaths (D) of influenza A (H5N1) virus infection reported to WHO (January 2003 to 23 June 2015), Western Pacific Region.**

Country	2003		2004		2005		2006		2007		2008		2009		2010		2011		2012		2013		2014		2015		Total	
	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D

Lao PDR	0	0	0	0	0	0	0	0	2	2	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	2	2
Viet Nam	3	3	29	20	61	19	0	0	8	5	6	5	5	5	7	2	0	0	4	2	2	1	2	2	0	0	127	64
<b>Total</b>	<b>4</b>	<b>4</b>	<b>29</b>	<b>20</b>	<b>73</b>	<b>28</b>	<b>15</b>	<b>10</b>	<b>16</b>	<b>11</b>	<b>11</b>	<b>9</b>	<b>13</b>	<b>9</b>	<b>10</b>	<b>4</b>	<b>9</b>	<b>9</b>	<b>9</b>	<b>6</b>	<b>30</b>	<b>17</b>	<b>13</b>	<b>6</b>	<b>5</b>	<b>1</b>	<b>237</b>	<b>134</b>

From 2003 to 23 June 2015, there have been 842 cases of human infection with avian influenza A (H5N1) virus reported from 16 countries worldwide. Of these cases, 447 were fatal, resulting in a CFR of 53%.

### Human infection with avian influenza A (H5N6) virus

One new human H5N6 avian influenza case was reported from China to WHO on 11 July 2015. The latest case was 37 year-old female from Diqing, Yunnan Province and passed away on 10 July. Since May 2014, four human cases of influenza A (H5N6) have been reported globally. All four cases were reported from China and recent two cases were both from Yunnan Province.

### Public health risk assessment for human infection with avian influenza A (H5) viruses

Whenever avian influenza viruses are circulating in poultry, sporadic infections and small clusters of human cases are possible in people exposed to infected poultry or contaminated environments, therefore sporadic human cases would not be unexpected.

With the rapid spread and magnitude of avian influenza outbreaks due to existing and new influenza A(H5) viruses in poultry in areas that have not experienced this disease in animals recently, there is a need for increased vigilance in the animal and public health sectors. Community awareness of the potential dangers for human health are essential to prevent infection in humans. Surveillance should be enhanced to detect human infections if they occur and to detect early changes in transmissibility and infectivity of the viruses. *For more information on confirmed cases of human infection with avian influenza A (H5) virus reported to WHO, visit:*

## Human infection with avian influenza A (H7N9) virus in China

On 16 July 2015, the National Health and Family Planning Commission (NHFPC) of China notified WHO of 5 additional laboratory-confirmed cases of human infection with avian influenza A (H7N9) virus, including 3 deaths. Onset dates ranged from 26 May to 18 June 2015. Cases ranged in age from 58 to 77 years with a mean age of 66 years. All of these 5 cases were male. Every case reported exposure to poultry related environment. No clusters were reported. Cases were reported from three provinces and one municipality: Anhui (2), Jiangsu (1), Shanghai (1), and Zhejiang (1).

WHO is assessing the epidemiological situation and conducting further risk assessment based on the latest information. Overall, the public health risk from avian influenza A (H7N9) viruses has not changed. Comparing with previous two months, the infection case number is decreasing and no new infected province was reported. Further sporadic human cases of avian influenza A (H7N9) infection are expected in affected and possibly neighbouring areas. Should human cases from affected areas travel internationally, their infection may be detected in another country during or after arrival. If this were to occur, community level spread is considered unlikely as the virus does not have the ability to transmit easily among humans

### Public health risk assessment for avian influenza A (H7N9) viruses

On 23 February 2015, WHO conducted a public health risk assessment for avian influenza A (H7N9). This assessment found the overall public health risk from avian influenza A (H7N9) viruses has not changed since the previous assessment, published on 2 October 2014. To date, there has been no evidence of sustained human-to-human transmission of avian influenza A (H7N9) virus.

## Animal infection with avian influenza

From 11 to 17 July 2015, in the Western Pacific Region, animal infection with avian influenza virus was reported in Taiwan, China.

### H5N2 HPAI outbreaks in birds, Taiwan, China

Three outbreaks of H5N2 HPAI infection in birds were reported in Taiwan, China. The outbreaks started on 28 June to 2 July 2015.
