

Human infection with avian influenza A (H5) viruses

Human infection with avian influenza A (H5N1) virus

From 18 to 24 September 2015, **no new cases** of human infection with avian influenza A (H5N1) virus were reported to WHO in the Western Pacific Region.

From February 2003 to 24 September 2015, 237 cases of human infection with avian influenza A (H5N1) virus were reported from four countries within the Western Pacific Region (Table 1). Of these cases, 134 were fatal, resulting in a case fatality rate (CFR) of 57%.

Table 1: Cumulative number laboratory-confirmed human cases (C) and deaths (D) of influenza A (H5N1) virus infection reported to WHO (January 2003 to 10 September 2015), Western Pacific Region.

Country	2003		2004		2005		2006		2007		2008		2009		2010		2011		2012		2013		2014		2015		Total	
	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D	C	D
Cambodia	0	0	0	0	4	4	2	2	1	1	1	0	1	0	1	1	8	8	3	3	26	14	9	4	0	0	56	37
China	1	1	0	0	8	5	13	8	5	3	4	4	7	4	2	1	1	1	2	1	2	2	2	0	5	1	52	31
Lao PDR	0	0	0	0	0	0	0	0	2	2	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	2	2
Viet Nam	3	3	29	20	61	19	0	0	8	5	6	5	5	5	7	2	0	0	4	2	2	1	2	2	0	0	127	64
Total	4	4	29	20	73	28	15	10	16	11	11	9	13	9	10	4	9	9	9	6	30	17	13	6	5	1	237	134

From 2003 to 17 July 2015, there have been 844 cases of human infection with avian influenza A (H5N1) virus reported from 16 countries worldwide. Of these cases, 449 were fatal, resulting in a CFR of 53%.

Human infection with avian influenza A (H5N6) virus

From 18 to 24 September 2015, **no new cases** of human infection with avian influenza A (H5N6) virus were reported to WHO in the Western Pacific Region. Since May 2014, four human cases of influenza A (H5N6) have been reported, globally, all four cases were reported from China.

Public health risk assessment for human infection with avian influenza A (H5) viruses

Whenever avian influenza viruses are circulating in poultry, sporadic infections and small clusters of human cases are possible in people exposed to infected poultry or contaminated environments, therefore sporadic human cases would not be unexpected.

With the rapid spread and magnitude of avian influenza outbreaks due to existing and new influenza A (H5) viruses in poultry in areas that have not experienced this disease in animals recently, there is a need for increased vigilance in the animal and public health sectors. Community awareness of the potential dangers for human health is essential to prevent infection in humans. Surveillance should be enhanced to detect human infections if they occur and to detect early changes in transmissibility and infectivity of the viruses.

For more information on confirmed cases of human infection with avian influenza A (H5) virus reported to WHO, visit:

http://www.who.int/influenza/human_animal_interface/en/

Human infection with avian influenza A (H7N9) virus in China

From 18 to 24 September 2015, **no new cases** of human infection with avian influenza A (H7N9) virus were reported to WHO in the Western Pacific Region.

WHO is continuing to assess the epidemiological situation and will conduct further risk assessments with any new information. Overall, the public health risk from avian influenza A (H7N9) viruses has not changed. Since the 16 July 2015, no new laboratory-confirmed human cases of avian influenza A(H7N9) virus infection were reported to WHO.

<http://www.who.int/csr/don/18-july-2015-avian-influenza-china/en/>

Further sporadic human cases of avian influenza A (H7N9) infection are expected in affected and possibly neighbouring areas. Should human cases from affected areas travel internationally, their infection may be detected in another country during or after arrival. If this were to occur, community level spread is considered unlikely as the virus does not have the ability to transmit easily among humans

Public health risk assessment for avian influenza A (H7N9) viruses

On 23 February 2015, WHO conducted a public health risk assessment for avian influenza A (H7N9). This assessment found the overall public health risk from avian influenza A (H7N9) viruses has not changed since the previous assessment, published on 2 October 2014. To date, there has been no evidence of sustained human-to-human transmission of avian influenza A (H7N9) virus.

Animal infection with avian influenza

From 18 to 24 September 2015, in the Western Pacific Region, four animal outbreaks with avian influenza virus were reported, two in Viet Nam and two in the Republic of Korea.

HPAI H5N1 outbreak in poultry, Viet Nam

Two new outbreaks of HPAI H5N1 infection in poultry were reported. The first outbreak started on 6 September 2015 in Vinh Long province with 940 cases. The other outbreak started on 18 September 2015 in Ha Tinh province with 200 cases.

HPAI H5N8 outbreak in poultry, Republic of Korea

Two new outbreaks of HPAI H5N8 infection in poultry were reported in Jeollanamdo Province. One outbreak started on 14 September 2015 in Naju-si city with 20 cases and the other outbreak also started on 14 September with 20 cases but occurred in Gangjin-gun county.
